

KA-9007

LOW PIM BRACKET ASSEMBLY

The Low-PIM Bracket is a part of Kaelus solutions for external PIM mitigation. External PIM sources come in many different forms, i.e. corroded metal, loose metal objects, or objects that are non-linear in the proximity of the radiating antenna.

Kaelus Low-PIM Bracket is designed to ensure that mounting solution of our products does not contribute to external PIM.

Kaelus are pioneers in PIM testing and has also developed a [PIM Finder](#) solution to identify the location of external PIM sources and provide guidance for mitigation of sources.

FEATURES

- The design and material is carefully chosen to minimize PIM
- Compatible with Kaelus products (see ordering information for details)
- Easy to install in field
- Verified to ensure that it does not create any external PIM
